Advice for applying
machine learning

Deciding what
to try next

Debugging a learning algorithm:

Suppose you have implemented regularized linear regression to predict housing prices.

$$\rightarrow J(\theta) = \frac{1}{2m} \left[\sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)})^2 + \lambda \sum_{j=1}^m \theta_j^2 \right]$$

However, when you test your hypothesis on a new set of houses, you find that it makes unacceptably large errors in its predictions. What should you try next?

- - Get more training examples
- Try smaller sets of features

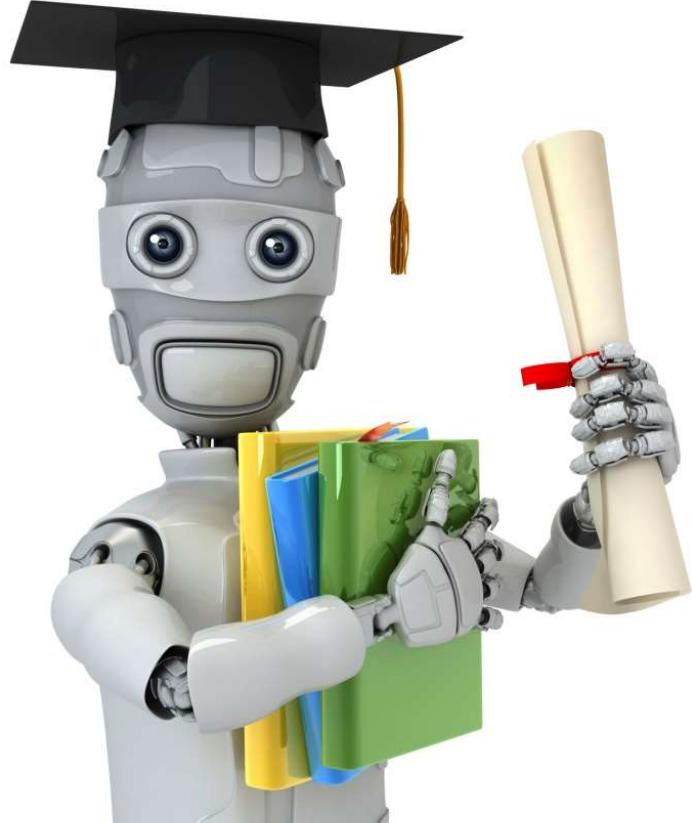

- - Try getting additional features
- Try adding polynomial features (x_1^2, x_2^2, x_1x_2 , etc.)
- Try decreasing λ
- Try increasing λ

$x_1, x_2, x_3, \dots, x_{100}$

Machine learning diagnostic:

Diagnostic: A test that you can run to gain insight what is/isn't working with a learning algorithm, and gain guidance as to how best to improve its performance.

Diagnostics can take time to implement, but doing so can be a very good use of your time.

machine learning

Evaluating a
hypothesis

Evaluating your hypothesis

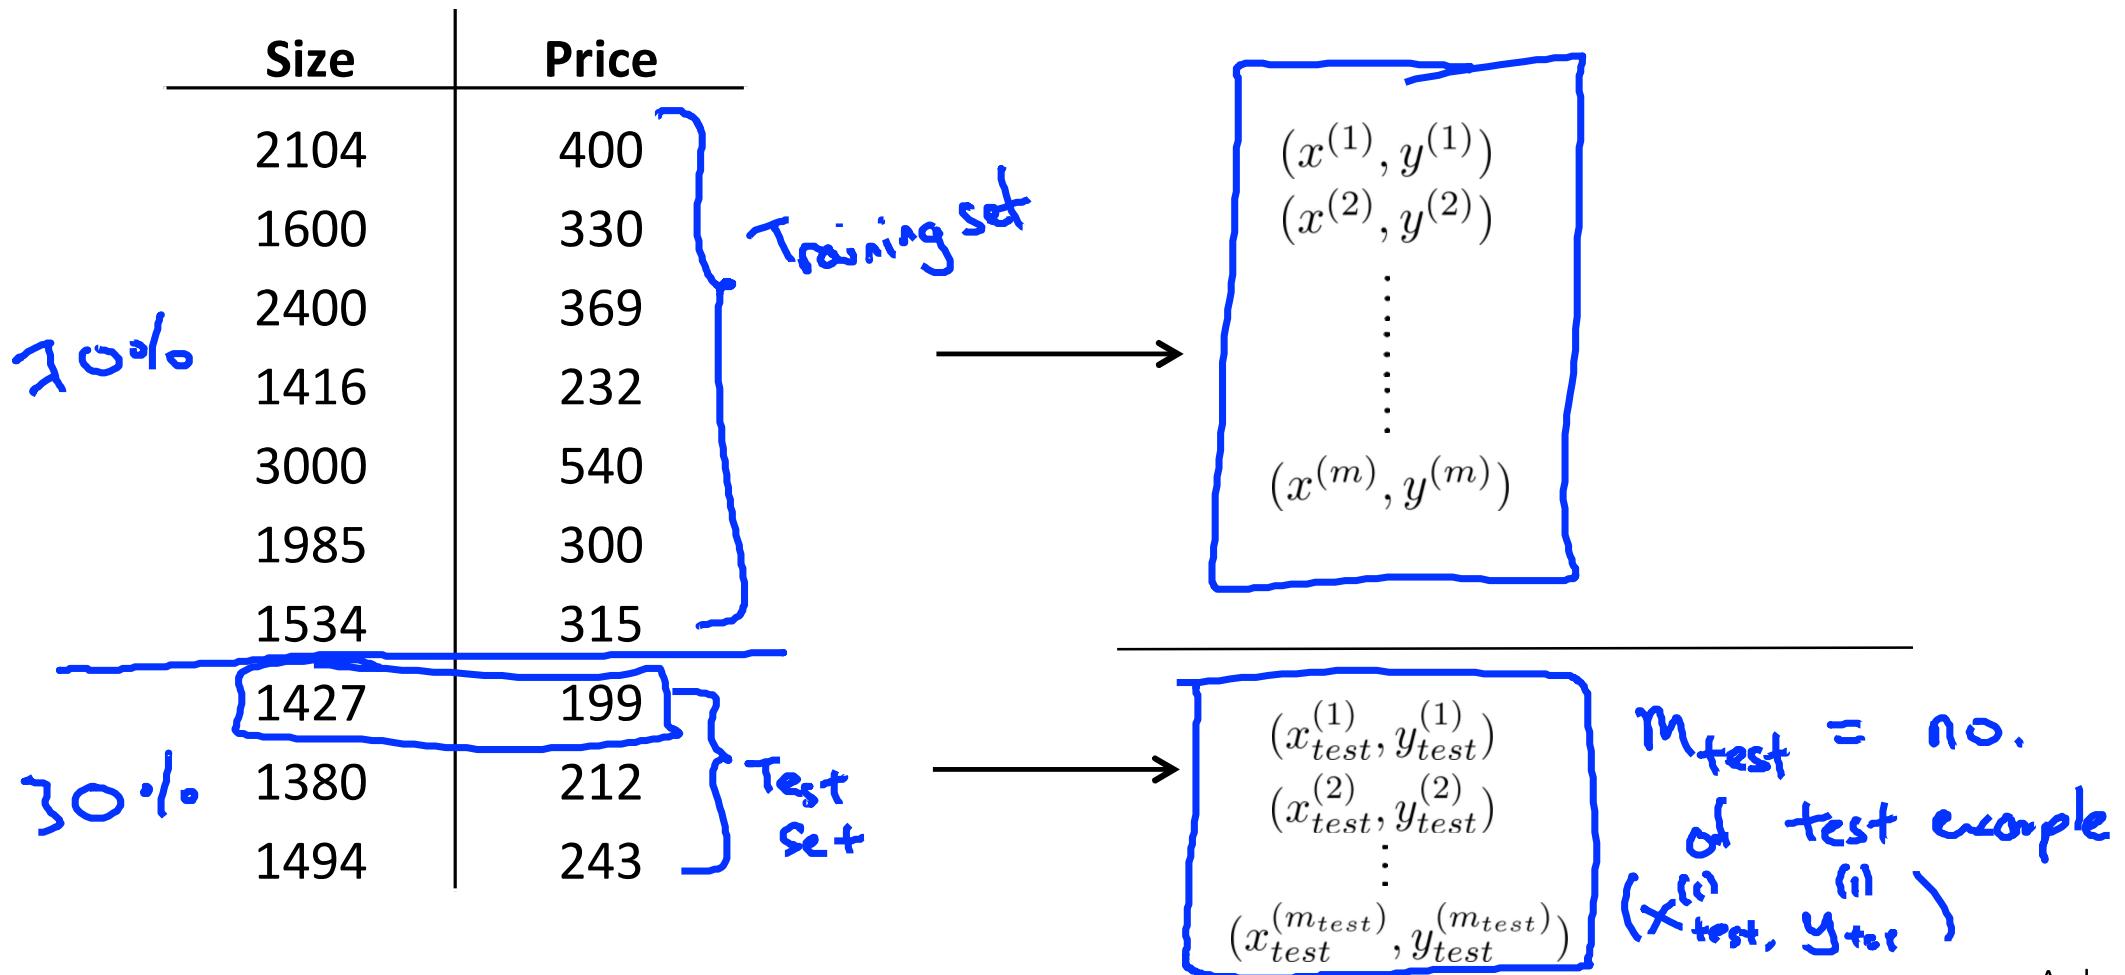

$$\rightarrow h_\theta(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$$

Fails to generalize to new examples not in training set.

- x_1 = size of house
- x_2 = no. of bedrooms
- x_3 = no. of floors
- x_4 = age of house
- x_5 = average income in neighborhood
- x_6 = kitchen size
- \vdots
- x_{100}

Evaluating your hypothesis

Dataset:

Training/testing procedure for linear regression

- - Learn parameter $\underline{\theta}$ from training data (minimizing training error $J(\theta)$) 70\%
- Compute test set error:

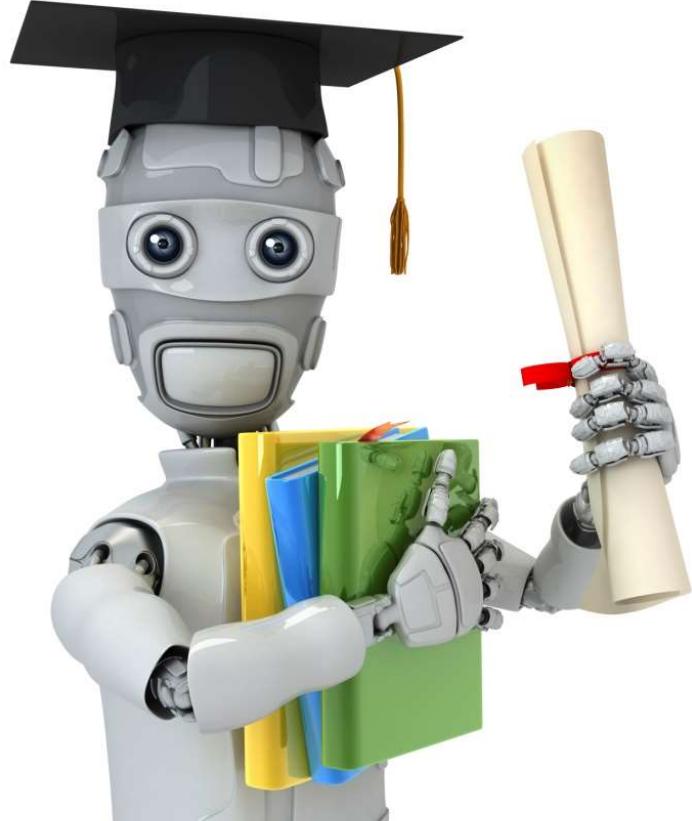

$$J_{\text{test}}(\theta) = \frac{1}{2m_{\text{test}}} \sum_{i=1}^{m_{\text{test}}} \left(h_{\theta}(x^{(i)}_{\text{test}}) - y^{(i)}_{\text{test}} \right)^2$$

Training/testing procedure for logistic regression

- Learn parameter θ from training data
- Compute test set error:

$$J_{test}(\theta) = -\frac{1}{m_{test}} \sum_{i=1}^{m_{test}} y_{test}^{(i)} \log h_\theta(x_{test}^{(i)}) + (1 - y_{test}^{(i)}) \log (1 - h_\theta(x_{test}^{(i)}))$$

- Misclassification error (0/1 misclassification error):

Model selection and
training/validation/test
sets

Overfitting example

$$h_{\theta}(x) = \underline{\theta_0} + \underline{\theta_1}x + \underline{\theta_2}x^2 + \underline{\theta_3}x^3 + \underline{\theta_4}x^4$$

Once parameters $\theta_0, \theta_1, \dots, \theta_4$ were fit to some set of data (training set), the error of the parameters as measured on that data (the training error $J(\theta)$) is likely to be lower than the actual generalization error.

Model selection

$$d=1 \quad 1. \quad h_{\theta}(x) = \theta_0 + \theta_1 x \rightarrow \Theta^{(1)} \rightarrow J_{test}(\Theta^{(1)})$$

$$d=2 \quad 2. \quad h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 \rightarrow \Theta^{(2)} \rightarrow J_{test}(\Theta^{(2)})$$

$$d=3 \quad 3. \quad h_{\theta}(x) = \theta_0 + \theta_1 x + \dots + \theta_3 x^3 \rightarrow \Theta^{(3)} \rightarrow J_{test}(\Theta^{(3)})$$

⋮
⋮

$$d=10 \quad 10. \quad h_{\theta}(x) = \theta_0 + \theta_1 x + \dots + \theta_{10} x^{10} \rightarrow \Theta^{(10)} \rightarrow J_{test}(\Theta^{(10)})$$

Choose $\theta_0 + \dots + \theta_5 x^5$ ←

How well does the model generalize? Report test set

error $J_{test}(\theta^{(5)})$. $\Theta^{(5)}$

Problem: $J_{test}(\theta^{(5)})$ is likely to be an optimistic estimate of generalization error. I.e. our extra parameter (d = degree of polynomial) is fit to test set.

$\Theta_0, \Theta_1, \dots$

Evaluating your hypothesis

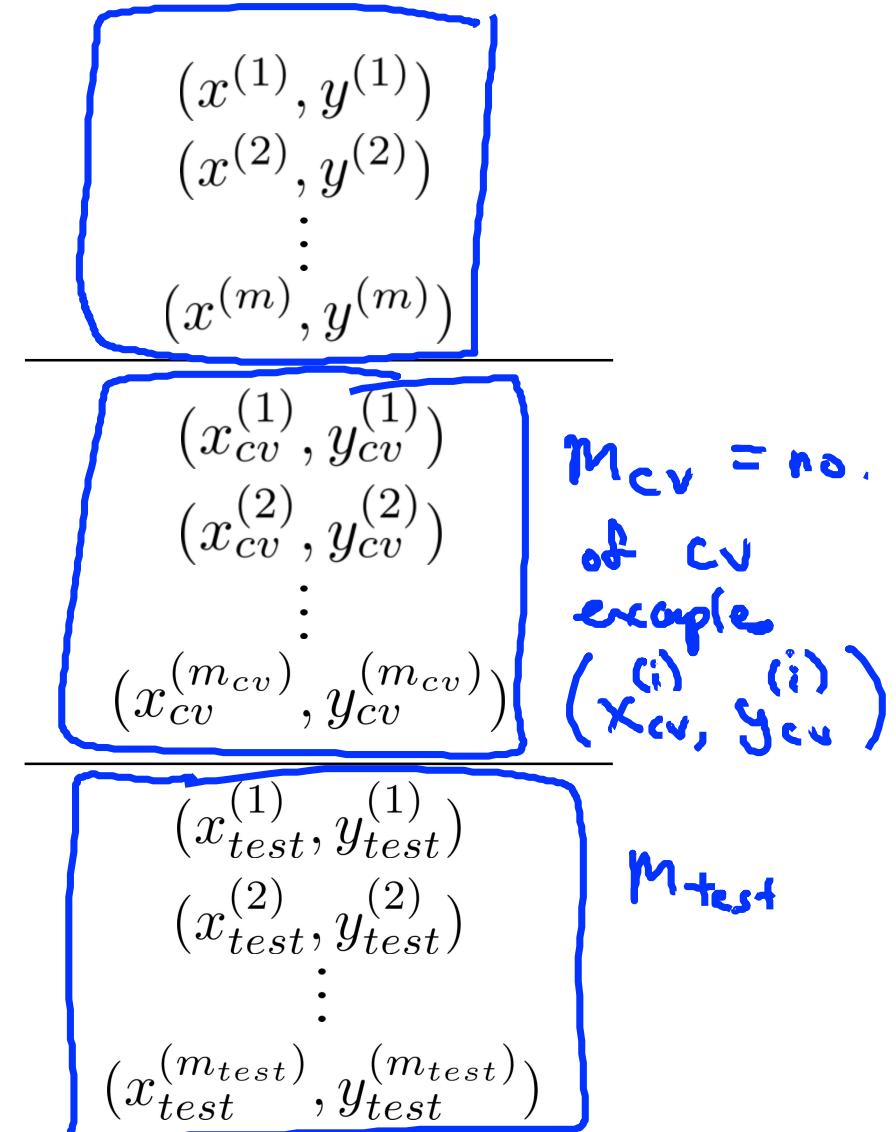

Dataset:

Size	Price
2104	400
1600	330
2400	369
1416	232
3000	540
1985	300
1534	315
1427	199
1380	212
1494	243

Training set

Cross validation set (CV)

test set

Train/validation/test error

Training error:

$$\Rightarrow J_{train}(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)})^2 \quad \text{J}(\theta)$$

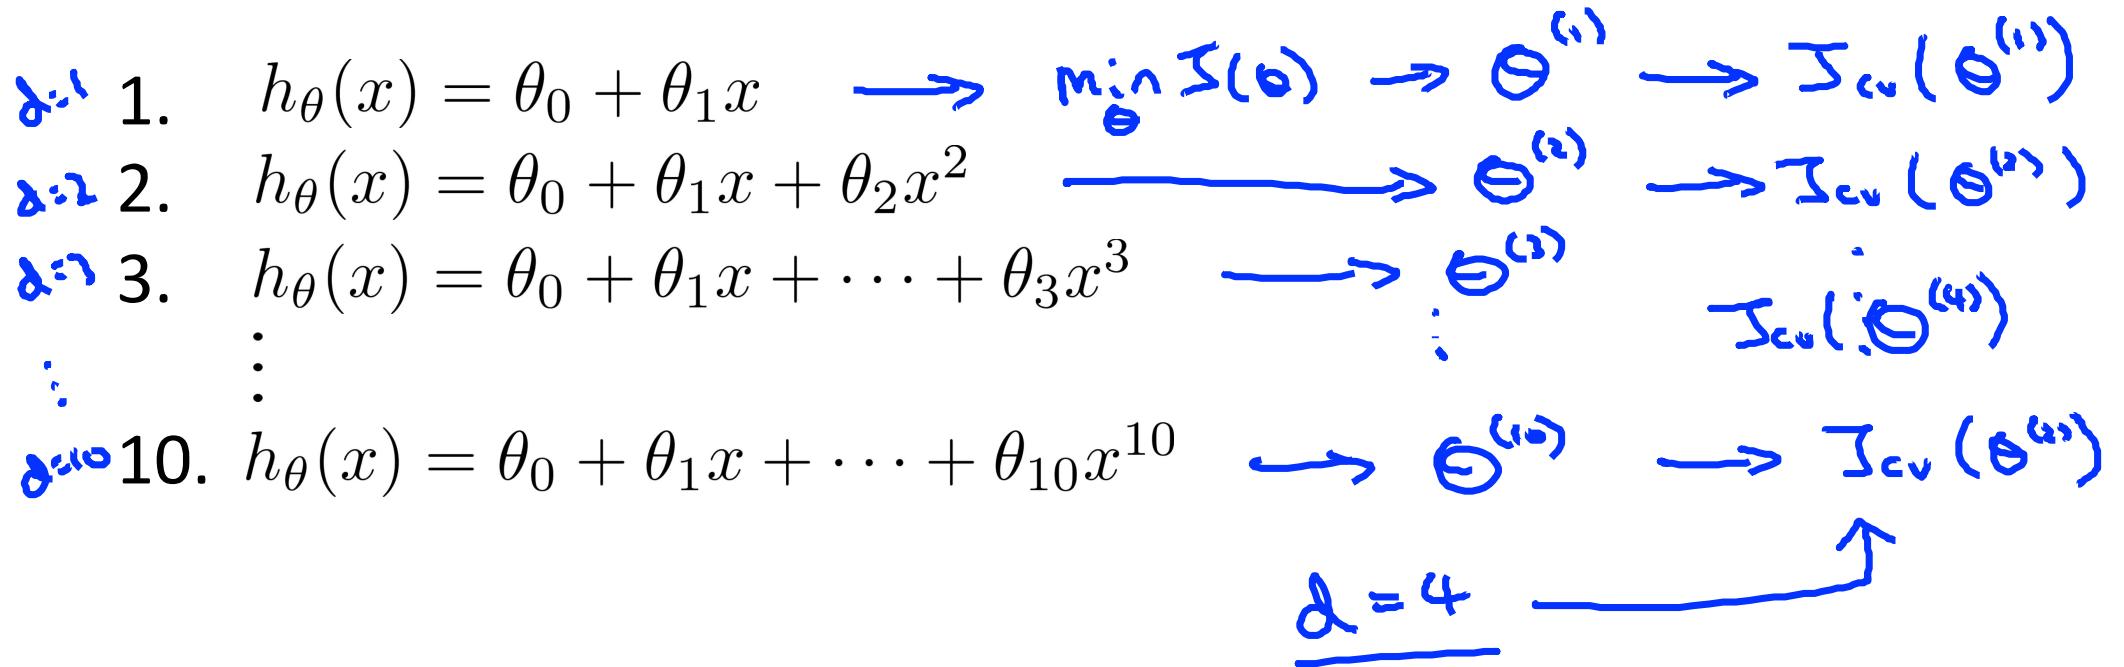

Cross Validation error:

$$\Rightarrow J_{cv}(\theta) = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_\theta(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$$

Test error:

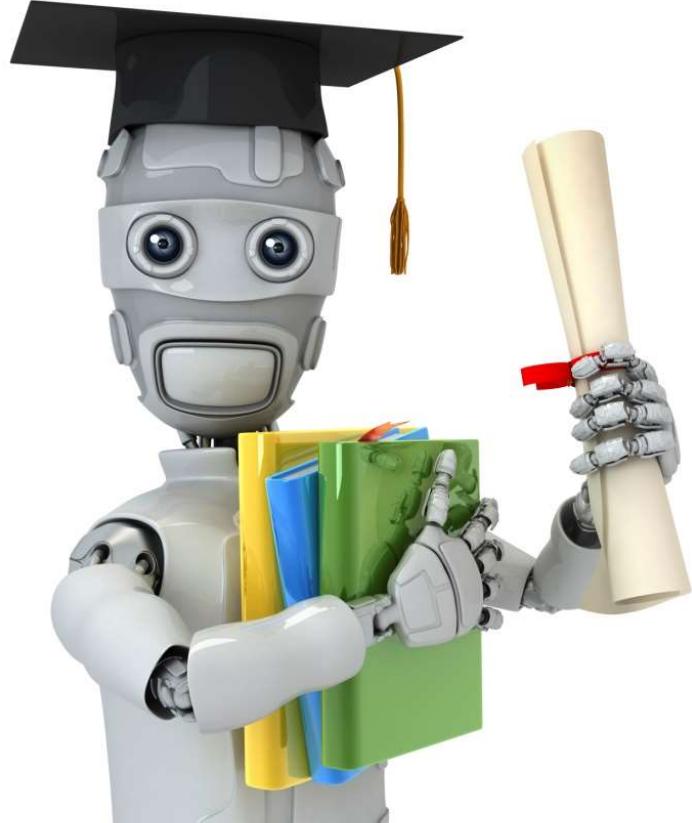

$$\Rightarrow J_{test}(\theta) = \frac{1}{2m_{test}} \sum_{i=1}^{m_{test}} (h_\theta(x_{test}^{(i)}) - y_{test}^{(i)})^2$$

Model selection

Pick $\theta_0 + \theta_1 x_1 + \dots + \theta_4 x^4 \leftarrow$

Estimate generalization error for test set $J_{test}(\theta^{(4)}) \leftarrow$

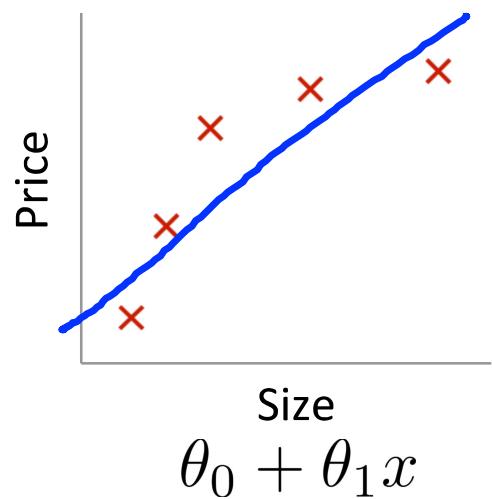

Machine Learning

Advice for applying machine learning

Diagnosing bias vs. variance

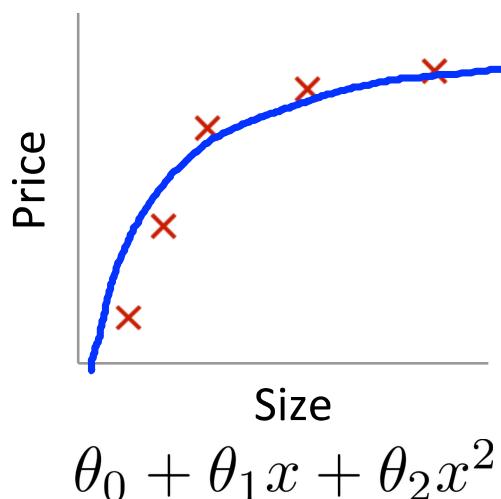

Bias/variance

$$\theta_0 + \theta_1 x$$

High bias
(underfit)

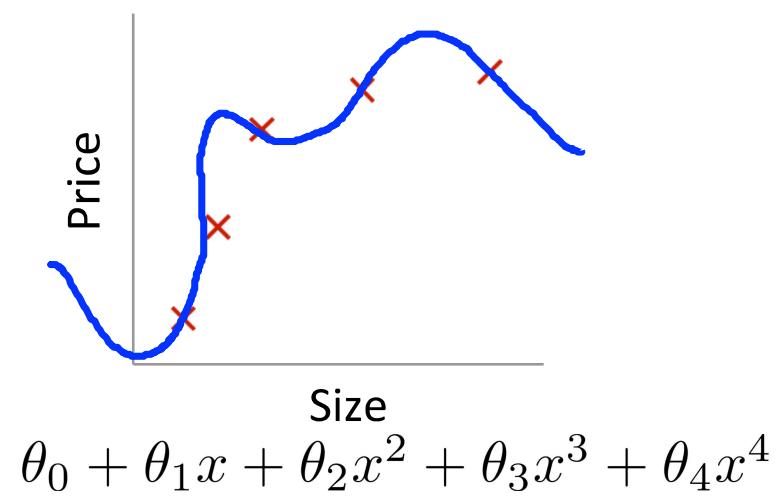

$$d=1$$

$$\theta_0 + \theta_1 x + \theta_2 x^2$$

"Just right"

$$d=2$$

$$\theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$$

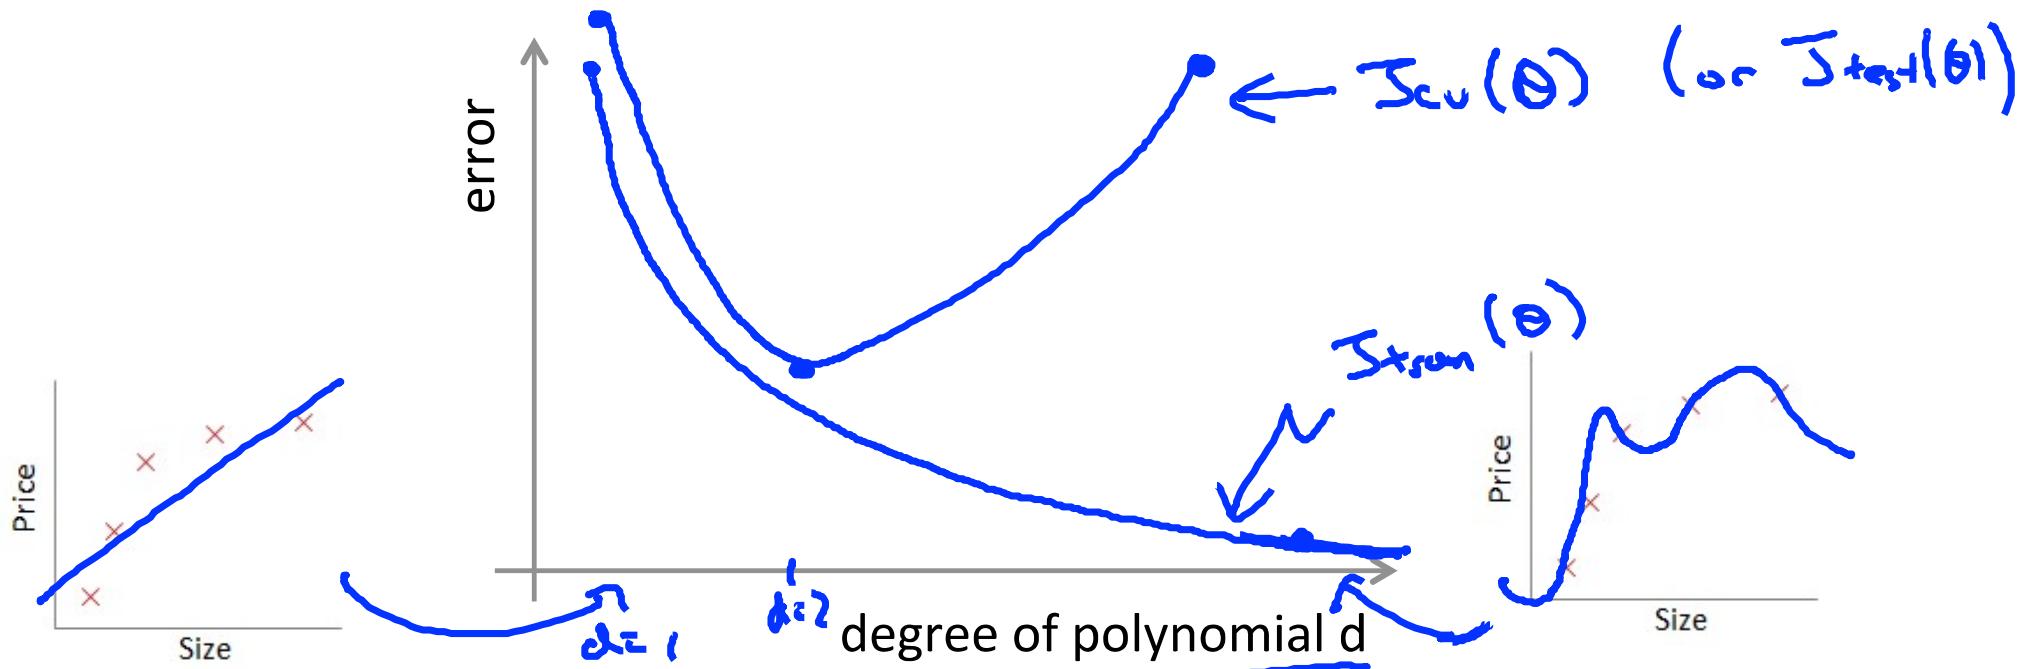

High variance
(overfit)

$$d=4$$

Bias/variance

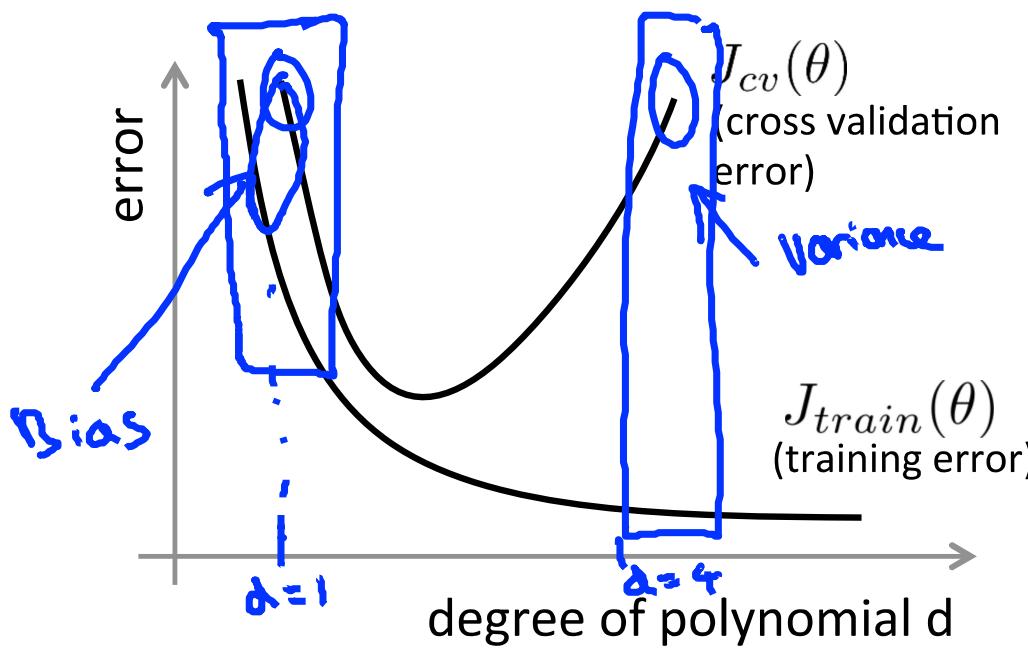

Training error: $\underline{J_{train}(\theta)} = \frac{1}{2m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)})^2$

Cross validation error: $\underline{J_{cv}(\theta)} = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_\theta(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$ (or $J_{test}(\theta)$)

Diagnosing bias vs. variance

Suppose your learning algorithm is performing less well than you were hoping. ($J_{cv}(\theta)$ or $J_{test}(\theta)$ is high.) Is it a bias problem or a variance problem?

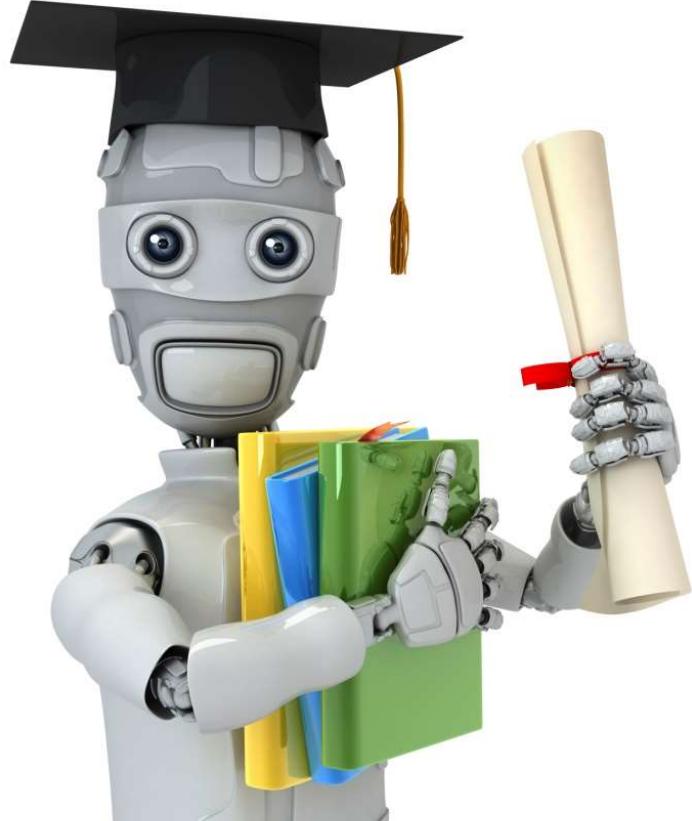

Bias (underfit):

→ $J_{train}(\theta)$ will be high }
 $J_{cv}(\theta) \approx J_{train}(\theta)$

Variance (overfit):

→ $J_{train}(\theta)$ will be low }
 $J_{cv}(\theta) \gg J_{train}(\theta)$

>>

Machine Learning

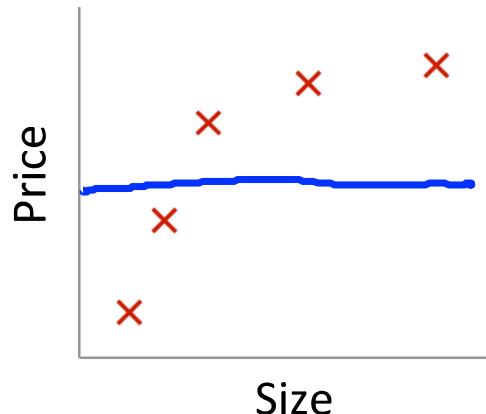

Advice for applying machine learning

Regularization and bias/variance

Linear regression with regularization

Model:
$$h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$$

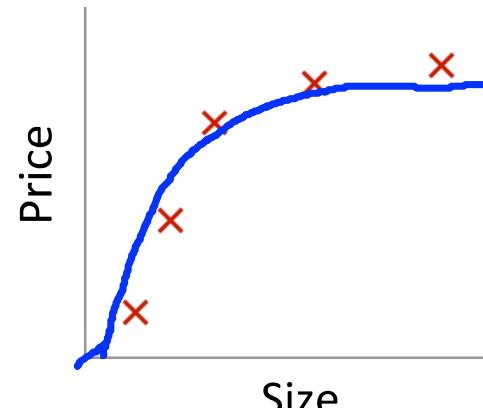

$$J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \frac{\lambda}{2m} \sum_{j=1}^m \theta_j^2$$

Large λ

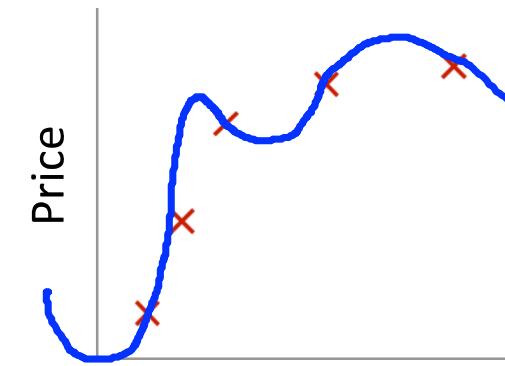

→ High bias (underfit)

$$h_{\theta}(x) \approx \theta_0$$

Intermediate λ

"Just right"

Small λ

High variance (overfit)

$$\rightarrow \lambda = 0$$

Choosing the regularization parameter λ

$$h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4 \quad \leftarrow$$

$$J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \frac{\lambda}{2m} \sum_{j=1}^m \theta_j^2 \quad \leftarrow$$

$$\rightarrow J_{train}(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 \quad J(\theta)$$

$$J_{cv}(\theta) = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_{\theta}(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$$

$$J_{test}(\theta) = \frac{1}{2m_{test}} \sum_{i=1}^{m_{test}} (h_{\theta}(x_{test}^{(i)}) - y_{test}^{(i)})^2$$

J_{train}
 J_{cv}
 J_{test}

Choosing the regularization parameter λ

Model: $h_{\theta}(x) = \theta_0 + \theta_1 x + \theta_2 x^2 + \theta_3 x^3 + \theta_4 x^4$

$$J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \frac{\lambda}{2m} \sum_{j=1}^m \theta_j^2$$

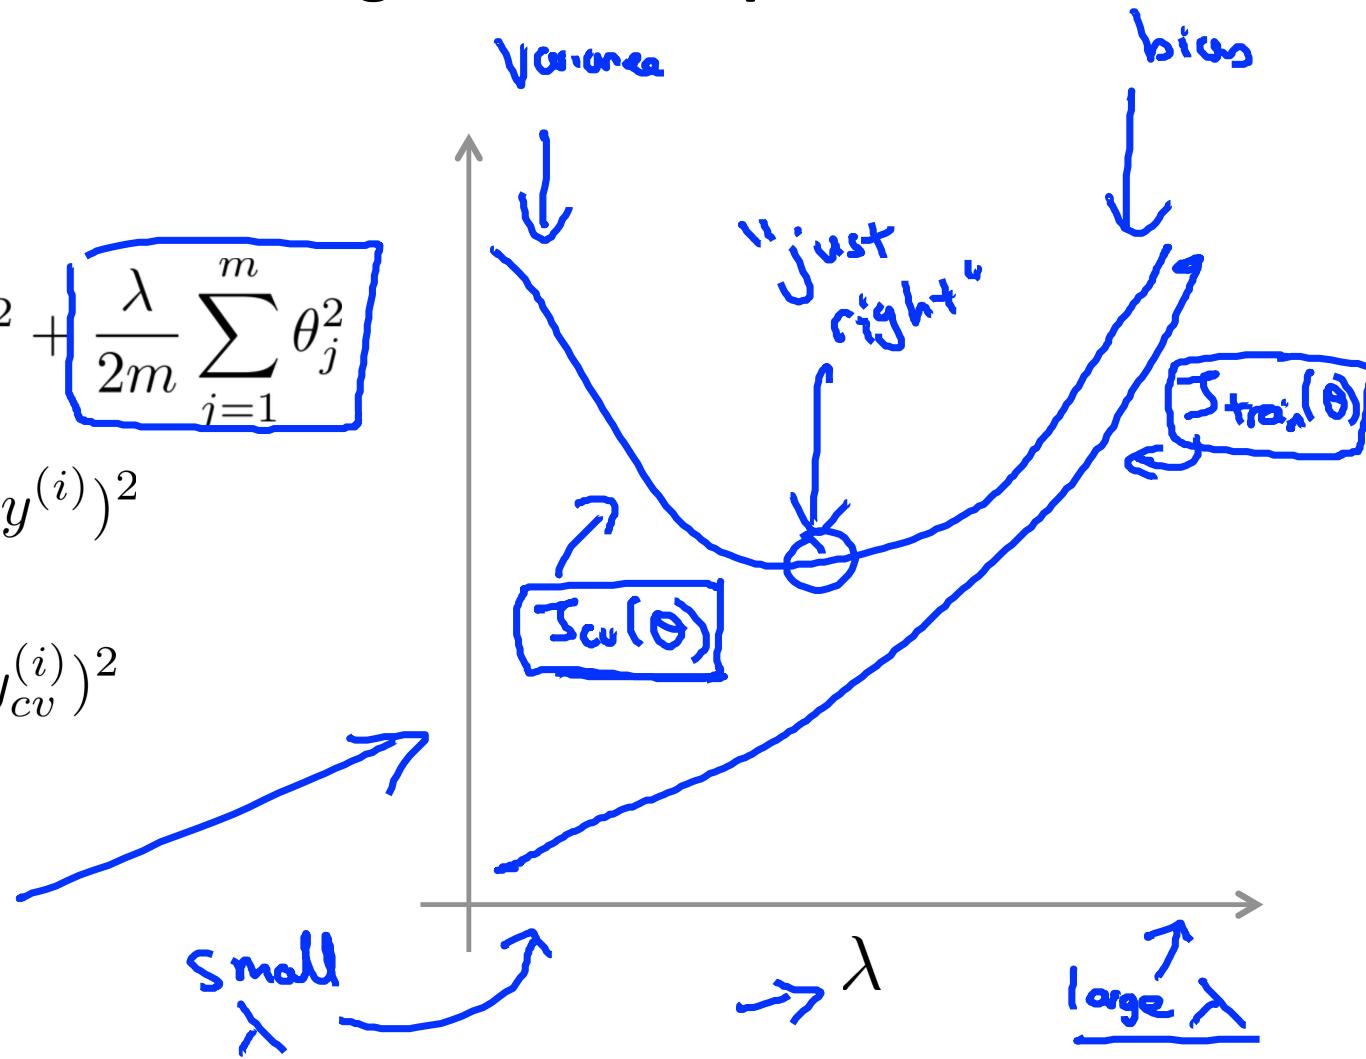

1. Try $\lambda = 0$ $\xrightarrow{\min_{\theta} J(\theta)} \theta^{(0)} \rightarrow J_{cv}(\theta^{(0)})$
 2. Try $\lambda = 0.01$ $\xrightarrow{\min_{\theta} J(\theta)} \theta^{(1)} \rightarrow J_{cv}(\theta^{(1)})$
 3. Try $\lambda = 0.02$ $\xrightarrow{\min_{\theta} J(\theta)} \theta^{(2)} \rightarrow J_{cv}(\theta^{(2)})$
 4. Try $\lambda = 0.04$
 5. Try $\lambda = 0.08$ $\vdots \xrightarrow{\min_{\theta} J(\theta)} \theta^{(5)} \rightarrow J_{cv}(\theta^{(5)})$
 - ⋮
 12. Try $\lambda = 10$ $\xrightarrow{\min_{\theta} J(\theta)} \theta^{(12)} \rightarrow J_{cv}(\theta^{(12)})$
- Pick (say) $\theta^{(5)}$. Test error: $J_{test}(\theta^{(5)})$

Bias/variance as a function of the regularization parameter λ

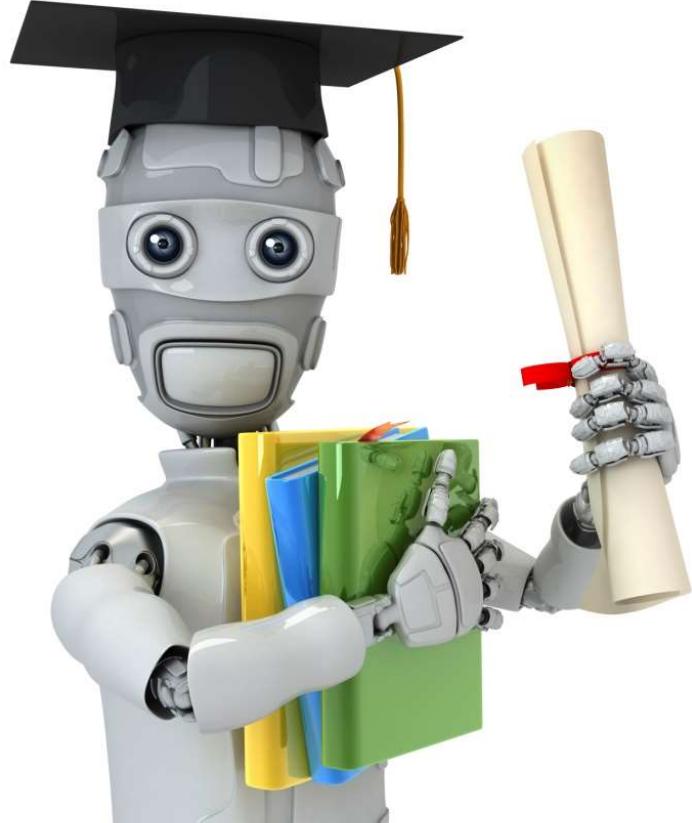

$$\rightarrow J(\theta) = \frac{1}{2m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)})^2 + \boxed{\frac{\lambda}{2m} \sum_{j=1}^m \theta_j^2}$$

$$\rightarrow \underline{J_{train}(\theta)} = \frac{1}{2m} \sum_{i=1}^m (h_\theta(x^{(i)}) - y^{(i)})^2$$

$$\rightarrow \boxed{J_{cv}(\theta)} = \frac{1}{2m_{cv}} \sum_{i=1}^{m_{cv}} (h_\theta(x_{cv}^{(i)}) - y_{cv}^{(i)})^2$$

Advice for applying machine learning

Learning curves

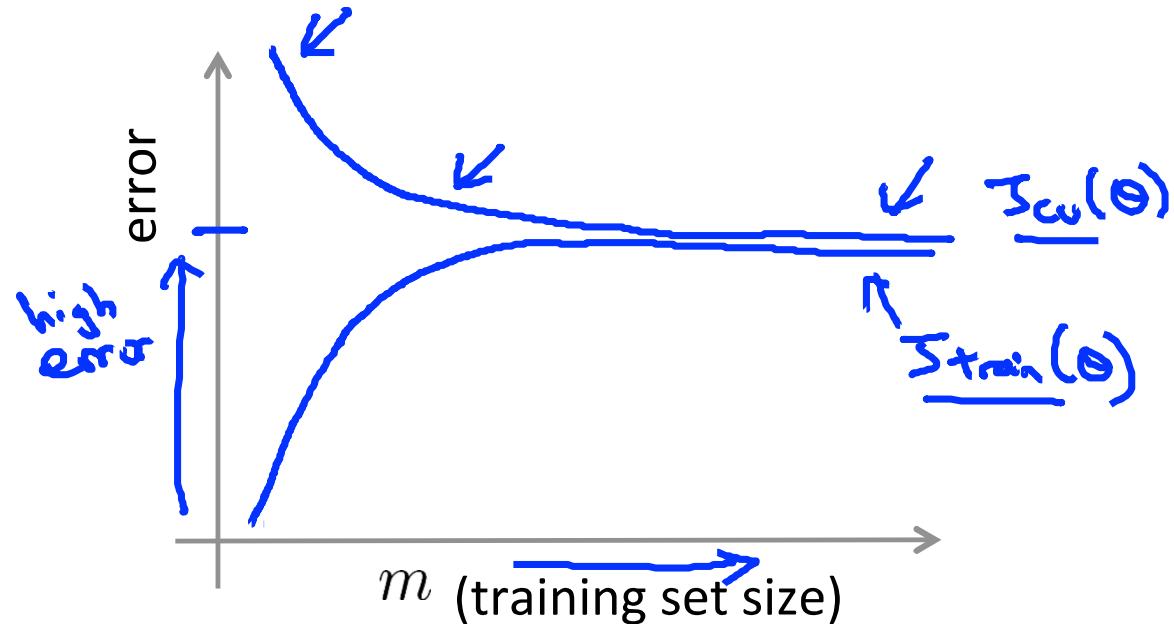

Learning curves

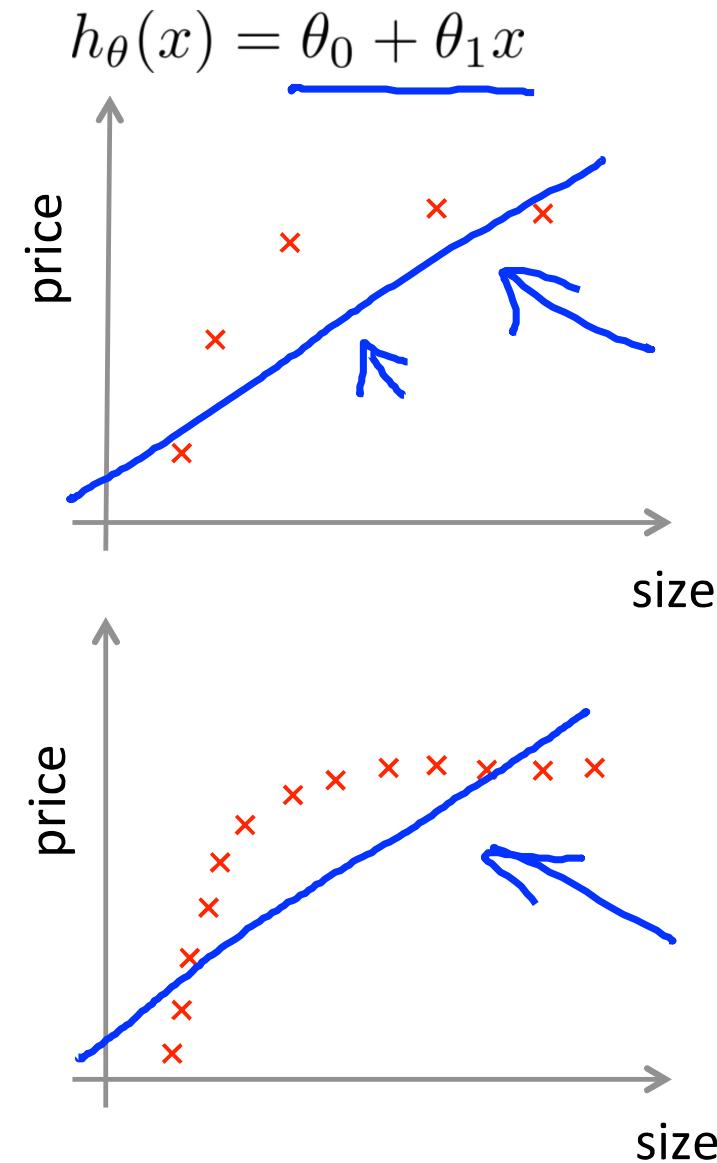

$$h_\theta(x) = \underline{\underline{\theta_0 + \theta_1 x + \theta_2 x^2}}$$

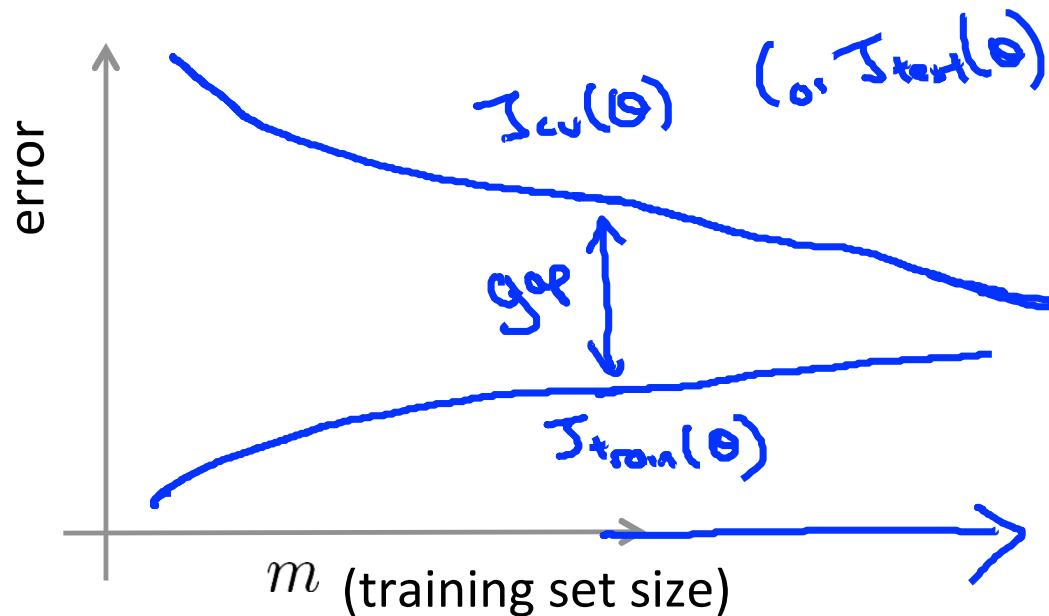

High bias

If a learning algorithm is suffering from high bias, getting more training data will not (by itself) help much.

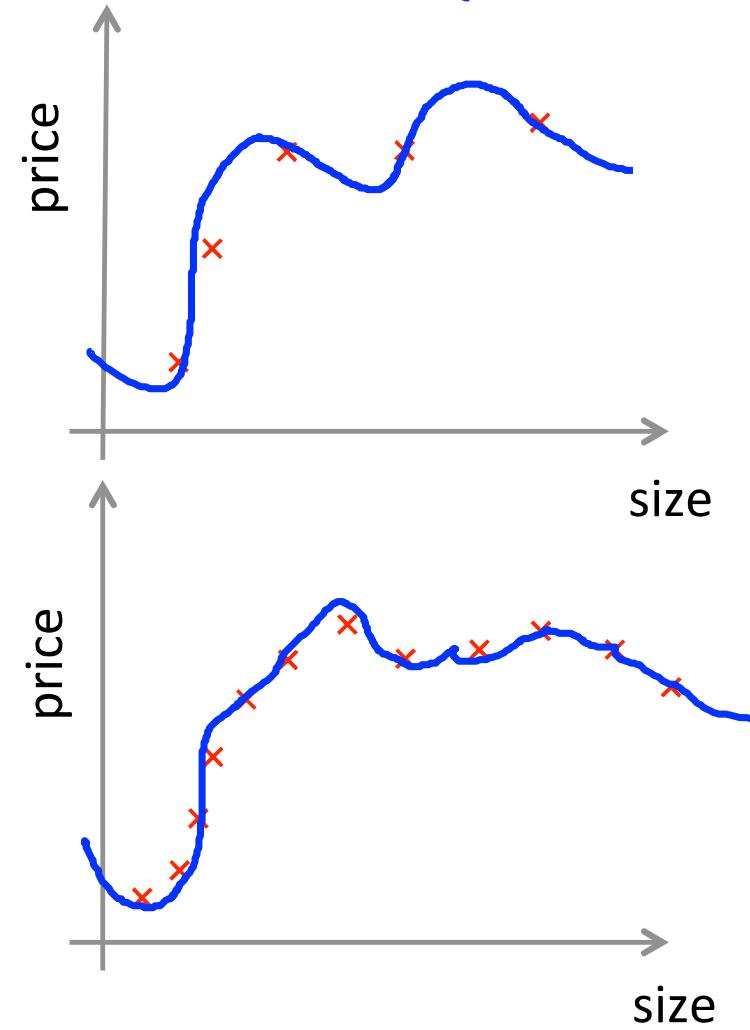

High variance

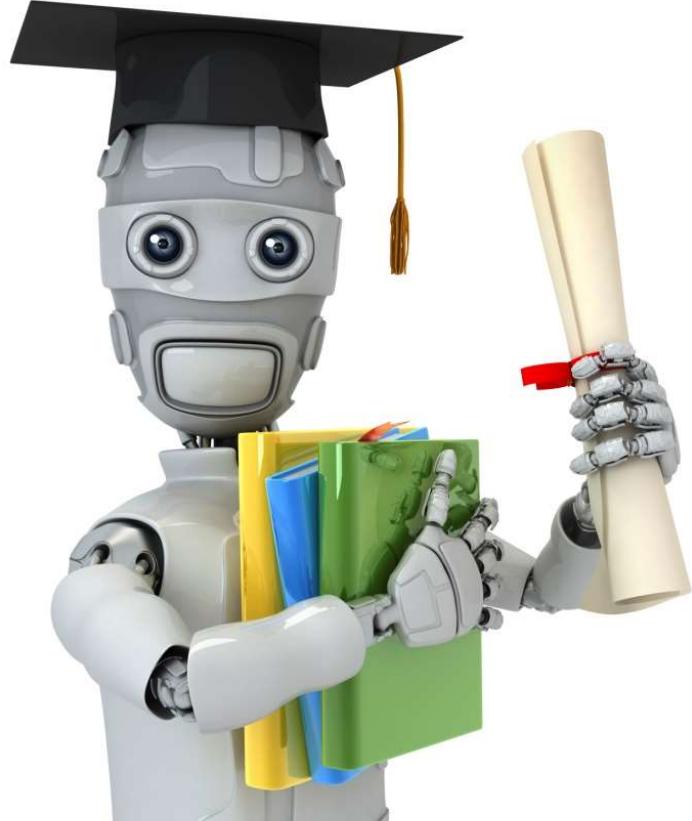

If a learning algorithm is suffering from high variance, getting more training data is likely to help. ↙

$$h_\theta(x) = \theta_0 + \theta_1 x + \cdots + \theta_{100} x^{100}$$

(and small λ) ↗

Deciding what to try next (revisited)

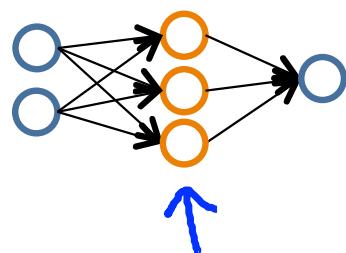

Debugging a learning algorithm:

Suppose you have implemented regularized linear regression to predict housing prices. However, when you test your hypothesis in a new set of houses, you find that it makes unacceptably large errors in its prediction. What should you try next?

- Get more training examples → fixes high variance
- Try smaller sets of features → fixes high variance
- Try getting additional features → fixes high bias
- Try adding polynomial features(x_1^2, x_2^2, x_1x_2 ,etc) → fixes high bias.
- Try decreasing λ → fixes high bias
- Try increasing λ → fixes high variance

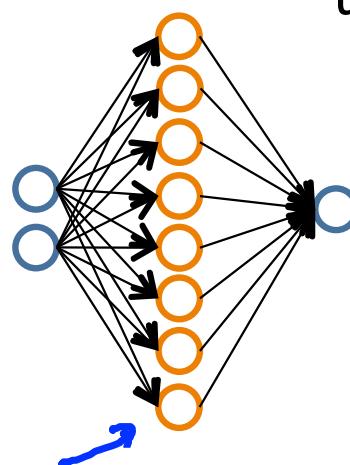

Neural networks and overfitting

→ “Small” neural network
(fewer parameters; more prone to underfitting)

Computationally cheaper

→ “Large” neural network
(more parameters; more prone to overfitting)

Computationally more expensive.

Use regularization (λ) to address overfitting.

$$\mathcal{J}_{\text{reg}}(\Theta)$$
